

Answer key — what the three sheets should say

Read each line to Riaz **without telling him what it is meant to say**. Write down what he reads, then compare. A line he cannot read at all is as useful a result as one he reads wrongly — note which it was.

All three sheets are within 28 cells and fit A4. They are generated by `tools/make_test_sheets.py` ; if you change a line here, change it there too.

Sheet 1 — `print-1-grade1.brf` (Grade 1, uncontracted)

LINE	WHAT IT TESTS	SHOULD READ
1–2	letters, first half	ا ب پ ت ث ٹ پ ج چ ڄ ح خ د ڌ ڍ ڏ ڙ ڙ
3–4	letters, second half	س ش ص ض ط ظ ع غ ف ق ک گ ڳ گ ل م ن ڻ و ه ي ء آ
5–6	digits	0 1 2 3 4 5 6 7 8 9
7	punctuation	:دم. دم، دم؟ دم! دم؛ دم
8–9	a plain sentence	.سنڌي ٻولي هڪ شاهوڪار ٻولي آهي
10	a question	اسان جي صوبي جو نالو ڇا آهي؟
11	the aspirates	جه گھ ڙھ لھ مھ ڻھ ڻھ
12	words ending in ه	پڙھ تھ بھ ڏوھ اولھ ڳاھ
13	the letter ڪ	ڪ کير ڪت لڪو دوڪو
14	a repeated word	.ٿورو ٿورو پائي
15	a number in a sentence	.ڪتاب جو قيمت 250 روپيا آهي
16	fractions	3/7 1/2 13/44
17	arithmetic	8 + 9 = 17
18	Roman numerals	VIII IX X
19	exercise labels	.ا. ب. ج. د
20	an abbreviation	حضرت آدم عليه السلام
21	a year	پاڪستان 14 آگسٽ 1947 عيسوي

One line to watch: line 11. The last item, ڻھ, is written 3456 then 236. Dots 3-4-5-6 at the start of a word are also the number sign, and 236 is also the lower 8 — so the same two cells can be read as ⅞. In real Sindhi this never arises, because no ordinary Sindhi word begins with ڻ, but on a bare letter list it does. ڻھ is one of only four spellings in the whole word list that this code cannot read back, and this collision is exactly why. **If Riaz reads that item as a fraction, that is the code behaving as printed, not a mistake in the file** — and it is worth asking him how a reader is meant to tell the two apart.

Sheet 2 — `print-2-grade2.brf` (Grade 2, contracted)

This is the one that has never been tested. Every line is shorter than the Sindhi it stands for.

LINE	WHAT IT TESTS	SHOULD READ
1	whole-word: one letter alone	اسين به ٻه ڀلو توهان ٿو
2	whole-word again	پر جو چيو جو دوست
3	dot 5 series	آهي اوهان بيھن ٻاھر ڀلائي
4	dots 4 5 series	اڳتي بابت پاڻ
5	dots 4 5 6 series	شروع جنھن صورت خراب اڳواڻ
6	dot 6 series	تيئن ته ڇاڪاڻ ته مطلب ته
7	Sindhi abbreviations	البتہ اتفاق امڪان بعد
8	groups inside a word	آباد آزارا
9	a whole sentence	.اسين ٿو وڃون. البتہ توهان ڀلو آهي

Sheet 3 — `print-3-poetry-maths-foreign.brf` (verse, arithmetic, other languages)

The three areas that had never been checked. Nineteen lines.

LINE	WHAT IT TESTS	SHOULD READ
1–4	the guide's four sums	$8 + 9 = 17 \cdot 20 - 13 = 7 \cdot 12 \times 8 = 96 \cdot 91 \div 7 = 13$
5	fractions	3/7 1/2 13/44
6	decimal, thousands, ratio	1.75 1,000 2:3
7	per cent — the sign comes before the number	50% 1%
8	round brackets in arithmetic (126, 345)	$(8 + 9) = 17$
9	braces	$\{12 + 3\} = 15$
10	Roman numerals	VIII IX X
11	one English word inside Sindhi	لفظ آهي Thanks هي
12–13	two English words — one pair of marks around both	آهي City School اسڪول جو نالو
14–15	capitals inside a longer English run	پڙهان ٿو Computer Science مان
16	an Urdu word — same script, no marks needed	هن ۾ اردو لفظ ڪتاب آهي
17–19	a bait in verse marks, with the pen-name	سند پٽائي جي يونءِ / هتي امن ۽ محبت آهي / لطيف چوي ٿو سچ

Line 3 is the one to watch. The multiplication sign is dots 5-6 2-3-6 — exactly the two cells that open a foreign word. Nothing in the cells themselves tells them apart; only whether a word follows with no space. Ask Riaz how a reader resolves it.

Lines 17–19 are the first verse ever set in this code by software. The marks are 12356 twice at the start of the stanza, once more attached to the end of each hemistich, a full stop at the end, and dot 2 immediately before لطيف. If any of that is not how a Sindhi braille reader expects a bait to look, that is exactly the finding worth having.

The same material to read on screen, with the dot numbers beside every line, is `CHECK-poetry-maths-foreign.html`.

Digital implementation by Safeer Ali Mirani, 2026, in partnership with Riaz Hussain Memon.
